Sequence 25, Application US/07789913

Patent NO. 5559095

GENERAL INFORMATION:
APPLICANT: Miljanich, George P.
APPLICANT: Bowersox, Stephen S.
APPLICANT: Pox, James A.
APPLICANT: Valentino, Karen L.
APPLICANT: Vanashiro, Donald H.
TITLE OF INVENTION: Delayed Treatment Method of Reducing TITLE OF INVENTION: Ischemia-Related Neuronal Damage
NUMBER OF SEQUENCES: 28
                    ; INDIVIDUAL ISOLATE: peptide fragment used in the claims US-07-789-913-23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ANTI-SENSE: NO

Patent No. 5707828

GENERAL INFORMATION:
APPLICANT: Steekrishna, Kotikanyadan
APPLICANT: Barr, Kathryn A.
APPLICANT: Thill, Gregory P.
APPLICANT: Thill, Gregory P.
TITLE OF INVENTION: EXPRESSION OF HUMAN SERUM ALBUMIN IN TITLE OF INVENTION: PICHIA PASTORIS
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSEE: Scully, Scott, Murphy & Presser
STREET: 400 Garden City Plaza
CURREST NACE OF CITY GARDEN CITY PLAZA
TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA AND TITLE OF INVENTION: METHODS OF PRODUCING ANALGESIA AND TITLE OF INVENTION: BUHANCING OPIATE ANALGESIA; NUMBER OF SEQUENCES: 34

CORRESPONDENCE ADDRESS;
ADDRESSEE: Law Offices of Peter Dehlinger STREET: 350 Cambridge Avenue, Suite 300

CITY: Palo Alto
STATE: CA
COUNTRY: USA
ZIP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CONOPEPTIDE GROUP 1 FRAGMENT, PAGE 32
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1; Indels

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.25

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/049,794

FILING DATE: 19930415

CLASSIFICATION: 514

PRIOR APPLICATION DATA:

APPLICATION NUMBER: US 07/814,759

FILING DATE: 30-DEC-1991

ATTORNEY/AGENT INFORMATION:

NAME: Stratford, Carol A.

REFERENCE/DOCKET NUMBER: 5865-0009.30

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 19,

GRENEAL INFORMATION:

APPLICANT: Carney, Darrell H.

APPLICANT: Carney, Roger S.

APPLICANT: Grewher, Roger S.

APPLICANT: Grewher, Roger S.

APPLICANT: Grewher, Roger S.

APPLICANT: Bergmann John

TITLE OF INVENTION: Grewhale, 1003-001

CURRENT APPLICATION NUMBER: US 60/219,800

FRIGE REPERCENCE: 2003-001

CURRENT APPLICATION NUMBER: US 60/219,800

FRICE REPERCENCE: 2000-07-20

MUMBER OF SEQ ID NOS: 5

SOFTWARE: PASTES OF WINGOWS Version 4.0

LENGTH: 14

TYPE: PR

PRATUR PRINTS

CORGANISM: Artificial Sequence

CRANION: (1). (14)

OTHER INVENTION: Xaa at position six is Glu or Gln

OTHER INVENTION: Xaa at position thirteen is Phe, Met, Leu, His or

US-09-982-172-11

US-09-982-172-11

Sequence 11, Application US/09982172

Patent No. US20020137119A1

GENERAL INFORMATION:

APPLICANT: Emil Israel Katz

TITLE OF INVENTION: UTILIZING EACH

TITLE OF INVENTION: UTILIZING EACH

TITLE OF INVENTION: UTILIZING EACH

FILE REFERENCE: 01/22283

CURRENT APPLICATION NUMBER: US/09/982,172

CURRENT FILING DATE: 2001-10-19

NUMBER OF SEQ ID NOS: 253

NUMBER OF SEQ ID NOS: 253

SEQ ID NO 11

SEQ ID NO 11
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:
APPLICANT: Emil Israel Katz
APPLICANT: Emil Israel Katz
TITLE OF INVENTION: PEPTIDES REPRESENTATIVE OF POLYPEPTIDES OF INTEREST AND ANTIBODIES
TITLE OF INVENTION: DIRECTED THEREAGAINST, AND METHODS, SYSTEMS AND KITS FOR GENERAT)
TITLE OF INVENTION: UTILIZING EACH
TITLE OF INVENTION: UTILIZING EACH
TITLE OF INVENTION: UNMBER: US/09/982,172
CURRENT APPLICATION NUMBER: US/09/982,172

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 69, Application US/09982172

Patent No. US2002013711941

GENERAL INFORMATION:

ADDITIONAL SEPTIMES REPRESENTATIVE OF POLYPEPTIDES OF INTEREST AND ANTIBODIE

TITLE OF INVENTION: DIRECTED THEREAGAINST, AND METHODS, SYSTEMS AND KITS FOR GENERAT

TITLE OF INVENTION: UTILIZING EACH

TITLE OF INVENTION: UTILIZING EACH

FILE REFERENCE: 01/22283

CURRENT APPLICATION NUMBER: US/09/982,172

CURRENT FILING DATE: 2001-10-19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 35, Application US/09982172

Patent No. US20020137119A1

Patent No. US20020137119A1

APPLICANT: Entl Israel Katz

TITLE OF INVENTION: DIRECTED THEREACAINST, AND METHODS, SYSTEMS AND KITS FOR GENERAT

TITLE OF INVENTION: UTILIZING EACH

FILE REFERENCE: 01/22283

CURRENT APPLICATION NUMBER: US/09/982,172

CURRENT APPLICATION NUMBER: US/09/982,172

CURRENT PILING DATE: 2001-10-19

NUMBER OF SEQ ID NOS: 253

SOFTWARE: PatentIn version 3.1

Sequence 83, Application US/09982172

BREENT NO. US20020137119A1

GENERAL INFORMATION:
APPLICANT: Emil lerael Katz

TITLE OF INVENTION: PEFFIDES REPRESENTATIVE OF POLYPEPTIDES OF INTERFEST AND ANTIBODIE.

TITLE OF INVENTION: DIRECTED THEREAGAINST, AND METHODS, SYSTEMS AND KITS FOR GENERATION TITLE OF INVENTION: UTILIZED CHARMATION: US/09/982,172

TITLE REFERENCE: 01/22283

CURRENT APPLICATION NUMBER: US/09/982,172

CURRENT FILING DATE: 2001-10-19

NUMBER OF SEQ ID NOS: 253

SOFTWARE PATENTIN VERSION 3.1

C; Genetics:
A; Rence zan
A; Map position: 5
C; Function:
A; Description: functions in multiple cell adhesion processes
A; Note: found exclusively on the apical region of the sperm head
C; Keywords: cell adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      scavenger receptor cysteine-rich protein precursor - sea urchin (Strongylocentrotus purp

Chymotrypsin/elastase inhibitor - common roundworm
C;Species: Ascaris lumbricoides (common roundworm)
C;Species: Ascaris lumbricoides (common roundworm)
C;Accession: 507127
R;Babin, D.R.; Peanasky, R.J.; Goos, S.M.
Arch. Blochem. Blochem. Blochys. 232, 143-161, 1984
Arthle: The isochhibitors of chymotrypsin/elastase from Ascaris lumbricoides: the prima A;Reference number: 507127; MulD:84255715; PMID:6564898
A;Accession: 507127
A;Molecule type: protein
A;Kesidues: 163 cBAB>
C;Superfamily: roundworm trypsin inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6 CGENEKYDSCGSKECDKKCKYDGVEEEDDEEPNVPCLVRVCHQDCVCE--EGFYRNKDDK 63

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also knowing a human leukcoyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLAA subtypes (HLAA21., A1, A3.2 or A24.1 or HLAAB or C) and induce a cytocoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLB) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighthing viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also used to induce a cytotoxic T cell response, by concacting a cytotoxic T cell with the peptide e.g. to be produce CTLB ex vivo for infusion back into a patient. The process of the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated human nucleic acids comprising one or more single nucleotide polymorphisms, useful for treating a subject suffering from a pathology, e.g. autoimmune diseases, ascribed to the presence of a

ABL00010 to ABL01104 represent human nucleic acid oligonucleotides
comprising one or more single nucleotide polymorphisms (SNPs). ABB56531
to ABB56903 represent human peptides encoded by some of the SNP
oligonucleotides. The sequences from the present invention can have
immunosuppressive, cytostatic, antiinflammatory, neuroprotective and
antimicrobial activities. Nucleic acids, polymorpides, oligonucleotides
antimicrobial activities. Nucleic acids, polymorpides, oligonucleotides
antibodies from the present invention can be used for treating a
subject suffering from, at risk for, or suspected of, suffering from a
pathology ascribed to the presence of a sequence polymorphism. The
company persent in individuals. In anticoorganisms. The SNPs
are also useful for determining which forms of a characterised
companyon quantitation and/or cellular or tissue localisation of a
polymorphic protein (e.g., for use in measuring levels of the
polymorphic protein within appropriate physiological samples).
                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

                                                   The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL16176-ABL36511), expressed DNA
                                                                                                                                                           Gaps

polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in disponsities as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                                                                        invention relates to isolated polynucleotide (I) and

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglopoletin, apoptosis related proteins, cacherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with in prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthitis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.
                                                                                                                                                                                                        Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroportective; antinicrobial; gene therapy; vaccine; amylase; cancer; amyloid protectiv; antinicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; anglopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytcohrome; kinesin; cytcokine; interferon; interleukh; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; aucommune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.0%; Score 0; DB 22; Length 1;

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, amplotosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colons stimulating factors, complement related proteins, cycokromes, kinesins, cytokines, interferons, interleukins, Gyrothermes, kinesins, cytokines, interferons, interleukins, Gyrotherm coupled receptors and thioesterases. The present sequence is a peptide encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with in prevention, diagnosis and treatment of diseases associated with be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, complement related proteins, cytochromes, kinesins, cytokines, complement related proteins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligonucleotide. The present sequence is a peptide encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with correspond to the proteins listed above. Disorders that may be prevented, diagnosed and/or treatment includes multifactorial diseases with a genetic component, such as auttoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and Grave's disease), inflammation, cancer (e.g. cancers of the blade brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms.

AA173060 to AA179867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPS).
AAM531314 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them any be used in the prevention, diagnosis and treatment of diseases sesociated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human nonconservative amino acid changing SNP related peptide SEQ:6914.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                AA173660 to AA179867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53312 represent peptides related to human polymorphic polynucleotide sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polymorphic polynucleotide sequences can be used in the prevention, diagnosis and treatment of diseases sesociated with inappropriate expression of polymorphic polypeptides.

For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic sassays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymorphic polymorphic properties in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human nonconservative amino acid changing SNP related peptide SEQ:6985.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

AA173660 to AA179867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNBs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides.

For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic sessays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be used as artigens in the therapy. The polypeptides encoded by (I) may be used as artigens in the antibodies may also be used to down regulate expression and activity.

The antibodies may also be used as diagnostic agents for detecting the
Polymorphic nucleic acid sequences, useful in genetic testing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   presence of polymorphic polypeptides in samples

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAM53328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
```

```
AA173060 to AA179867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53129 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases
                                                                                                                                                                                        associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations for deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
